### Customer Story

**Ron has been on a mission to make his home climate resilient and more environmentally friendly.**

**For Ron, it all started back in 1980 while speaking with some climate experts at Connecticut Public TV.** 40 years later when he saw that their predictions were happening in real time, he decided to implement clean energy changes and turned to the Connecticut Green Bank for help.

After getting an energy audit on his house, he took their advice and replaced his windows that were from the 1950's sealed the drafts, and added insulation. Then, to address their heating and cooling needs, they installed heat pumps. In the spring of 2023, Ron launched into the process of going solar and adding battery storage to the system. Once energized, the solar will produce enough power for all of their needs.

### Location

Cos Cob, CT

### Energy Upgrade

Heat pumps, solar PV system, battery storage

"If you can do all these things and step back and take your time to plan it properly, you'll come up with a nice system. This is a system that will help you, which will help all of us, which will help the state of Connecticut because we are all in this together. So whatever we can do to help your neighbor, your friends, your family, it benefits all of us."
